

COVID Risk Reduction Protocol from Rob Smith

Robert G. Smith of Germantown Monthly Meeting has learned and shared with our meeting that, since the risk of Covid-19 infection is greatly increased by deficiencies of vitamin C, vitamin D, magnesium, zinc, and selenium, supplements of these vitamins and minerals will help to reduce the risk of infection. Since this scientific information may help to save lives, we hope that other Friends Meetings will take the time to consider and utilize it.

The suggested doses are larger than the RDA, but have been observed to be effective. Suggested adult doses are: vitamin C, 1000 mg 3x per day (take less if you get a laxative effect), vitamin D, 5000 IU per day, magnesium, 400 mg per day (in malate, citrate, or chloride form), and zinc, 20 mg per day. In addition, take a one-a-day multivitamin that includes selenium. These supplements are inexpensive and safe, and are an excellent way to reduce your risk. Appropriate doses for children are proportional to body weight. You should discuss this information with your doctor.
